Make decisions to launch new dishes, manage customers, or even refuse service to difficult patrons, while balancing profits and debts each round. He skidded to a stop inches from my shoes, kicked his board up into his hand, and grinned like the whole world belonged to him. Jace Ryder. Six feet of reckless confidence and bruised knees. He smelled like trouble and citrus body spray, and for some reason, every girl in town wanted to be the ramp he launched off. Not me. Or maybe shove him into traffic. But unfortunately, this skater punk just became my biggest competition... and my new neighbor.

The second test question in my series of ten asks the AI to explain educational constructivism to a five-year-old. Image generation took a loooong time, more than five minutes each. The picture got the kid's baseball uniform quite right, including the logo on the cap and even properly spelling "New York" on the shirt (something AIs have had difficulty with). It failed on the fourth Back to the Future-themed challenge, with a "I can't generate that image because it would violate copyright policies" message. It did, however, create a fourth image (of a techno-witch), meaning I didn't hit any resource limitation walls on the free tier.

If you do, let us know what you think of the results in the comments below. Rather than taking the easy way out and spewing a bunch of specs and model names at you, I approached the ranking process by running each chatbot through a series of real-world tests. AI chatbots have become hugely popular, often saving folks a lot of work, while also putting jobs at risk. They have transformed education, writing, coding, and more. ZDNET's recommendations are based on many hours of testing, research, and comparison shopping. How to Use AI Chat Easily

Grok's free offering absolutely aced the travel itinerary test question. It didn't include images, but gave the most personal and usable itinerary of all of the chatbots. The response just felt the most "human" of all the itineraries I've seen. The Chatbox AI service only uses the data you send to produce AI replies, and your data may be temporarily stored on Chatbox AI's servers to expedite responses for subsequent inquiries. Chatbox AI does not permanently store your data and will not use it for

other purposes, including but not limited to advertising, model training, or any other commercial use.

Build and train Conversational Agents to answer questions, make recommendations, and handle concurrent conversations with your end users. Chatbots use large language models (LLMs) to produce conversational responses. These LLMs are trained based on insanely huge amounts of information, books, documents, websites, and more, all of which build up their knowledge base. Because everything should be reduced to a car analogy, let's do that here. Think of the chatbot interface as the cabin of the car, where the driver controls the vehicle.

Its web search (both in my tests and in other random searches I've done in the past) just didn't seem any better than a typical Google search. Other AI features were adequate, but I didn't find anything that made this stand out better than the tools that scored higher. You can play with it for free, so give it a try and let me know if you agree in the comments below. I finally decided to try with my personal account. I'm not paying for Gemini in that account, but my personal account does have some Google paid features attached to it. That was the only way I could get Gemini to produce images.

AI Chat also supports brainstorming, idea generation, and problem solving, making it a versatile AI assistant for everyday needs. Unlock the power of artificial intelligence with ChatSonic.AI, your gateway to cutting-edge conversational AI models. Our AI writing tools help you create compelling content instantly. On one test, I ask the AIs to explain the academic concept to a five-year-old. There are also four image tests that include generating a flying aircraft carrier, a giant robot, a young baseball player in a medieval court, and an homage to the movie Back to the Future. Stay productive with our AI chatbot that is always available to chat, answer questions, and create content in real time.

It was the first day of the new school year, and the whole building buzzed with excitement. Lockers slammed, friends reunited, and the scent of fresh notebooks filled the air. But then, a sudden announcement crackled through the intercom... You are currently studying you know what and she is basically what all the guys in school talk about. She wants to keep you behind in class today what does she wanna talk about?

When running in incognito mode and logged out, the image generator refused to do any image generation at all, saying it couldn't. When I tried using Grok from my Twitter/X account, it produced all four, but they could have been better. The baseball player looked like he was in a Medieval Times restaurant rather than in actual medieval times. Grok also displayed an interesting quirk that was kind of charming.

Testing the chatbots consisted of ten questions that resulted in text output, along with four prompts intended to produce images. I started with the following eight questions designed to produce a wide variety of answers. DeepSeek did fine on the basic factual questions, but did poorly on the travel itinerary and job interview support prompts. It also returned buggy code on the coding challenge. Image generation created a link to a Google URL that doesn't exist.

- Grok also displayed an interesting quirk that was kind of charming.
- Juggling multiple AI platforms wastes time and breaks your flow.

- On Day 5, it suggested visiting Google's offices in Cambridge.

The Back to the Future test was definitely evocative of the movie, except the kid was dressed differently and the bottom of the skateboard had a giant "McFly" painted on it. The DeLorean wasn't movie-perfect, but it fit the theme. The kid in King Arthur's court was pretty much perfect.

AI chatbots leverage AI, ML, NLU, NLP, and LLMs to deliver human-like responses to human input. AI chatbots are trained on large amounts of data and use ML to intelligently generate a wide range of non-scripted, conversational responses to human text and voice input. The last text-based test was taken from my 10 prompt tricks article, and was arguably the most fun. Trick number 2 asks the AI to write a short story about a bookshop and its back room.

Context Aware

Perplexity did a fine job explaining an academic concept, identified a math sequence, discussed a cultural issue with context, and analyzed the key themes from a well-known book. Having the sources up front and visible was nice, too. For my long-form story request, the AI first thought I was asking for an image. Weirdly, the AI boldfaced random words throughout the story. I found the 3,379-word story good enough, but a little hard to follow. The story also seemed to try to force-fit random concepts into the overall narrative, as if the AI wasn't entirely sure how to knit the whole piece together.

Amber Ballard is a 36-year-old office manager and part-time interior-design consultant who frequently visits your home to spend time with your wife, her closest friend. Raised in an emotionally reserved Midwestern family, Amber learned to be responsible, dependable, and private about her struggles. She is married to Troy, the hardworking owner of a construction business, and they have an eleven-year-old daughter named Maddie. Although Amber still cares for Troy and respects his dedication to their family, his increasing focus on work has left their marriage distant and routine. She deeply values her friendship with your wife but quietly envies the warmth, trust, and affection she sees between the two of you.

The Back to the Future image looked very much like Marty McFly with a skateboard, with a DeLorean ripped from the movie set. Gemini used the new Nano Banana image model, which is quite good. The details of the tests and the exact questions I asked are provided at the end of this article. That way, you can try my tests with any or all of the chatbots in your own browser window.

Generative AI Models Explained: Types, Examples, and How They Work

For test prompts, I pulled the four image prompts shown in my comparison of image generators article. This is particularly interesting because the last test asks for a representation of the movie Back to the Future and is meant to test how the AIs respond to potential guardrails about copyrighted content. Even though it's very old, I chose Back to the Future because its imagery is iconic and known to almost everyone. Instead of generating just one image, it generated four.

There’s not a person on the other end, but instead a piece of software. I tested eight of the most well-known chatbots equally, but three of them didn’t produce strong enough results to be in the top five. Latin translation and cultural context were good. It left out some very edge cases, but what it generated was good enough to ship.

Common Questions About AI Chat

It definitely makes my workflow more efficient. I had a problem where one of my PDF files wouldn’t process, so I contacted support. They responded the same day and helped me resolve it. That made me feel more confident in using the platform long-term.

Generative AI is therefore an exciting opportunity to enhance our productivity and creativity. Nation AI is a natural language-based chatbot that uses OpenAI’s GPT-5 and GPT-4 AIs to respond to users. Accessible free of charge, and without creating an account. Although I already have a long-running set of AI coding tests, it’s important when evaluating a chatbot to see if it can code, even in the free tier. For this test, I turned to Test 2 in my evaluation suite, which is a test of JavaScript regular expression code. I read each response from the AIs carefully to identify where each AI was strong and weak.

Doing the hands-on tests netted a number of fairly big surprises. I were particularly surprised by just how much value is being provided by the AI vendors for free. With a top overall score, ChatGPT is the overall winner. Let’s first explain my hands-on approach, tell you about a few surprises, and then we’ll explain why ChatGPT won the top spot.

The idea is to see whether an AI can sustain a longer context for an answer and how creative it can get. Some of the responses were fairly weak, but some were truly fun reads. An AI chatbot is really a general-purpose interface to an AI language model.

The overall scores are the sum of both score categories for a total of 120 points. I'm also avoiding AI model mentions (like GPT-5 vs. GPT-5-mini) here because the AI companies treat their free AI tiers like gumbo. Gumbo is often a restaurant offering made of whatever meat, poultry, or seafood leftovers are available. While almost always tasty, there's never a guarantee that the exact same gumbo experience will be repeated from day to day. Likewise, AI companies tend to provide whatever lower-resource-intensive models are available at the time to their free-tier users, and those models may change at any time.
